Abstract Extensive photoelectric photometry was carried out at Szeged Observatory using the 0.4-m Cassegrain-type telescope with an SSP-5A photometer during 1994–1997. We have observed mainly pulsating stars (Cepheids, δ Scutitype variables), although eclipsing binaries have been observed as well. As the observatory lies in a moderately light-polluted environment, we outline a possible way that small observatories can pursue scientific projects using UBV and uvby photometry.

Photoelectric Photometry With a Small Automatic Telescope (Abstract)

E. Norman Walker

Deudneys Cottage, Old Road, Hestmonceux, East Sussex, BN27 1PU, England

Malcolm S. Gough

Roger D. Pickard

Crayford Manor House Astronomical Society, Mayplace Road East, Crayford, Kent. DA1 4HB, England

Abstract Results of observations using the Jack Ells Automatic Photometric Telescope are presented.

PICA Project—a Short Description (Abstract)

Jan Mánek

Štefánik Observatory, Petřín 205, 118 46 Praha 1, Czech Republic

Abstract A brief description of the PICA (Precise Identification and Coordinate Adjustment) project is given, together with its goals, procedures used, and a description of target object selection.
